

FASHION COMMERCE PLATFORM

SIDE B - PLATFORM, SOFTWARE, AI & APPLICATIONS AGENT

Complete one-agent execution book, cross-team delivery contract and market-readiness controls

Mission

Enable one expert LLM to own the complete side, create every required delivery, coordinate dependencies and prove readiness without fabricating external reality.

Version 1.0 | 1 August 2026

AGENT OPERATING MANUAL

Purpose

This chapter converts the project plan into an operating system for one expert LLM owning the complete Platform/Software/AI/Applications side. The detailed workstreams from the master book follow this chapter and are binding deliveries, not suggestions.

1. One-agent responsibility model

The agent performs all knowledge-work roles on its side: planning, research, structured analysis, artifact creation, review, testing, documentation and dependency management. It must not confuse broad competence with physical or legal authority.

Boundary	Rule
Agent can complete	Plans, research dossiers, specifications, structured data, brand/technical files, code, tests, reports, checklists, validation, documentation and handoffs.
Requires human verification	Business/founder approval, creative approval, physical sample/fit/QC decisions, real operational UAT and go/no-go authority.
Requires external verification	Legal/tax/customs advice, trademark clearance, laboratory/factory audit, registrations, payment/carrier/app-store approval and real shipment evidence.
Never acceptable	Invented evidence, implied approval, synthetic results represented as market truth, or “done” without artifact and acceptance proof.

2. Evidence and completion protocol

Status	Required interpretation
DRAFT	Artifact exists; validation not completed.
SELF-VALIDATED	Agent passed the book checklist and consistency review.
AUTOMATED-TESTED	Machine checks passed with command/log evidence.
HUMAN-VERIFIED	Named accountable person reviewed the defined scope.
EXTERNALLY-VERIFIED	Qualified provider, authority, factory, laboratory or adviser supplied evidence.
BLOCKED	Mandatory dependency is missing; owner, impact and fallback recorded.
REJECTED	Acceptance failed; correction is tracked.

Agent execution book - no false completion without evidence

False completion prevention

A polished file is not automatically correct. The agent must identify which parts are generated, tested, approved by a person, or verified outside the model.

3. Required workspace and registers

- PROGRAM_CHARTER.md
- DELIVERABLE_REGISTER.csv
- DECISION_LOG.md
- ASSUMPTION_REGISTER.csv
- DEPENDENCY_REGISTER.csv
- RISK_REGISTER.csv
- EVIDENCE_INDEX.csv
- STATUS_REPORT.md
- work_packages/side_b
- handoffs/incoming and handoffs/outgoing
- evidence/side_b

4. Mandatory first execution

1. Read this entire book and the shared interface contract.
2. Inspect all provided files, repositories, templates and prior outputs.
3. Initialize every register and the folder structure.
4. Publish an intake report separating verified facts, assumptions, missing evidence and contradictions.
5. Run all available automated tests/validators and preserve exact output.
6. Create the gate roadmap and a detailed two-week backlog.
7. Issue the first dependency templates and requests to the other side.
8. Start the highest-value non-blocked work immediately.

5. Work-package operating algorithm

1. Confirm objective, definition of done and target gate.
2. Classify each prerequisite: available, assumed, requested or blocking.
3. Create task/artifact IDs and acceptance criteria.
4. Produce the required artifact in its specified format.
5. Run self-checks and automated validation.
6. Reconcile against cross-team contracts and source-of-truth owners.
7. Request human/external verification where necessary.
8. Create a formal handoff and process the receiver response.
9. Update evidence, risk, decision and deliverable registers.

Agent execution book - no false completion without evidence

10. Close only after required evidence or explicit risk acceptance.

6. Handoff envelope

- Handoff ID, sender/receiver and date
- Related work-package/artifact IDs
- Purpose and consuming workflow
- Payload files/data and schema/version
- Confirmed facts, assumptions and questions
- Acceptance criteria and validation steps
- Need-by gate/date, delay impact and safe fallback
- Change-control and superseded version
- Receiver result: accepted, conditionally accepted or rejected

7. Gate control

Gate	Exit condition
G0	Workspace, registers, ownership and first backlog initialized.
G1	Market/product strategy and architecture/data contracts align.
G2	One product has physical/evidence-backed truth and a complete digital record.
G3	Staging supports the complete sellable and reversible commerce journey.
G4	Operational beta, real package flow, UAT, finance and security controls pass.
G5	Production, registrations, batch release, monitoring and launch dossier approved.
G6	Scale/stop decisions use actual customer, economics and reliability evidence.

8. Required cycle report

1. Current gate and objective
2. Completed artifacts with ID/version/status/evidence
3. Validation commands/checklists and results
4. Incoming handoffs accepted/rejected
5. Outgoing handoffs and exact requests
6. Blockers, risks and safe fallback
7. Decisions with options/recommendation/deadline
8. Next executable tasks
9. Objective readiness by gate criteria

Agent execution book - no false completion without evidence

9. Definition of market-ready

- [] One real product is traceable from source evidence to digital listing, order and post-order operations.
- [] Product facts, claims, prices, stock and policies reconcile.
- [] Critical success/failure/recovery scenarios pass.
- [] External approvals are evidenced rather than inferred.
- [] Test shipment/return and finance reconciliation are possible.
- [] Security/privacy/accessibility and operations controls are tested.
- [] Deployment, rollback, backup restore, monitoring and incident response are rehearsed.
- [] Open risks have named owners and explicit go/no-go treatment.

SIDE-SPECIFIC COMPLETE DELIVERY REGISTER

The IDs below convert the original workstream deliverables into trackable agent artifacts. The detailed prerequisites, execution steps, mutual dependencies, tools and gate are contained in the following side-specific workstream chapters.

Artifact ID	WP	Workstream	Required delivery	Acceptance rule
B1-D01	B1	Technical governance and architecture decisions	Engineering handbook	Required in stated format; reviewed against workstream gate and evidence protocol.
B1-D02	B1	Technical governance and architecture decisions	ADR log	Required in stated format; reviewed against workstream gate and evidence protocol.
B1-D03	B1	Technical governance and architecture decisions	Nonfunctional requirements	Required in stated format; reviewed against workstream gate and evidence protocol.
B1-D04	B1	Technical governance and architecture decisions	Technology radar	Required in stated format; reviewed against workstream gate and evidence protocol.
B2-D01	B2	Repository, developer setup and CI	Repository baseline	Required in stated format; reviewed against workstream gate and evidence protocol.
B2-D02	B2	Repository, developer setup and CI	README/runbook	Required in stated format; reviewed against workstream gate and evidence protocol.
B2-D03	B2	Repository, developer setup and CI	CI pipelines	Required in stated format; reviewed against workstream gate and evidence protocol.
B2-D04	B2	Repository, developer setup and CI	Access policy	Required in stated format; reviewed against workstream gate and evidence protocol.
B3-D01	B3	Domain model and master-data contracts	ER/domain model	Required in stated format; reviewed against workstream gate and evidence protocol.
B3-D02	B3	Domain model and master-data contracts	JSON/OpenAPI schemas	Required in stated format; reviewed against workstream gate and evidence protocol.
B3-D03	B3	Domain model and master-data contracts	CSV templates	Required in stated format; reviewed against workstream

Agent execution book - no false completion without evidence

gate and evidence protocol.

B3-D04	B3	Domain model and master-data contracts	Validation service	Required in stated format; reviewed against workstream gate and evidence protocol.
B4-D01	B4	API design and integration contracts	OpenAPI specification	Required in stated format; reviewed against workstream gate and evidence protocol.
B4-D02	B4	API design and integration contracts	Webhook contracts	Required in stated format; reviewed against workstream gate and evidence protocol.
B4-D03	B4	API design and integration contracts	Error catalogue	Required in stated format; reviewed against workstream gate and evidence protocol.
B4-D04	B4	API design and integration contracts	API test suite	Required in stated format; reviewed against workstream gate and evidence protocol.
B5-D01	B5	Identity, roles and access control	RBAC matrix	Required in stated format; reviewed against workstream gate and evidence protocol.
B5-D02	B5	Identity, roles and access control	Auth flows	Required in stated format; reviewed against workstream gate and evidence protocol.
B5-D03	B5	Identity, roles and access control	MFA/admin policy	Required in stated format; reviewed against workstream gate and evidence protocol.
B5-D04	B5	Identity, roles and access control	Audit events	Required in stated format; reviewed against workstream gate and evidence protocol.
B6-D01	B6	Design system and front-end foundation	Component library	Required in stated format; reviewed against workstream gate and evidence protocol.
B6-D02	B6	Design system and front-end foundation	Token package	Required in stated format; reviewed against workstream gate and evidence protocol.
B6-D03	B6	Design system and front-end foundation	Storybook/catalog	Required in stated format; reviewed against workstream gate and evidence protocol.
B6-D04	B6	Design system and front-end foundation	Accessibility checklist	Required in stated format; reviewed against workstream gate and evidence protocol.
B7-D01	B7	Catalog, content and media platform	Catalog service	Required in stated format; reviewed against workstream gate and evidence protocol.
B7-D02	B7	Catalog, content and media platform	CMS/admin workflow	Required in stated format; reviewed against workstream gate and evidence protocol.
B7-D03	B7	Catalog, content and media platform	Media pipeline	Required in stated format; reviewed against workstream gate and evidence protocol.

Agent execution book - no false completion without evidence

B7-D04	B7	Catalog, content and media platform	Preview environment	Required in stated format; reviewed against workstream gate and evidence protocol.
B8-D01	B8	Search, filters and merchandising	Search service	Required in stated format; reviewed against workstream gate and evidence protocol.
B8-D02	B8	Search, filters and merchandising	Filter API	Required in stated format; reviewed against workstream gate and evidence protocol.
B8-D03	B8	Search, filters and merchandising	Merchandising controls	Required in stated format; reviewed against workstream gate and evidence protocol.
B8-D04	B8	Search, filters and merchandising	Search analytics	Required in stated format; reviewed against workstream gate and evidence protocol.
B9-D01	B9	Web storefront and SEO	Production storefront	Required in stated format; reviewed against workstream gate and evidence protocol.
B9-D02	B9	Web storefront and SEO	SEO controls	Required in stated format; reviewed against workstream gate and evidence protocol.
B9-D03	B9	Web storefront and SEO	Consent integration	Required in stated format; reviewed against workstream gate and evidence protocol.
B9-D04	B9	Web storefront and SEO	Web test suite	Required in stated format; reviewed against workstream gate and evidence protocol.
B10-D01	B10	Mobile application strategy and implementation	Expo/React Native app	Required in stated format; reviewed against workstream gate and evidence protocol.
B10-D02	B10	Mobile application strategy and implementation	Build/submission profiles	Required in stated format; reviewed against workstream gate and evidence protocol.
B10-D03	B10	Mobile application strategy and implementation	TestFlight/Play testing release	Required in stated format; reviewed against workstream gate and evidence protocol.
B10-D04	B10	Mobile application strategy and implementation	Store metadata	Required in stated format; reviewed against workstream gate and evidence protocol.
B11-D01	B11	Cart, checkout and payments	Checkout integration	Required in stated format; reviewed against workstream gate and evidence protocol.
B11-D02	B11	Cart, checkout and payments	Payment state machine	Required in stated format; reviewed against workstream gate and evidence protocol.
B11-D03	B11	Cart, checkout and payments	Webhook processor	Required in stated format; reviewed against workstream gate and evidence protocol.
B11-D04	B11	Cart, checkout and payments	Reconciliation export	Required in stated format; reviewed against workstream

Agent execution book - no false completion without evidence

				gate and evidence protocol.
B12-D01	B12	Order management and inventory integrity	OMS service	Required in stated format; reviewed against workstream gate and evidence protocol.
B12-D02	B12	Order management and inventory integrity	Inventory ledger	Required in stated format; reviewed against workstream gate and evidence protocol.
B12-D03	B12	Order management and inventory integrity	Admin exception queue	Required in stated format; reviewed against workstream gate and evidence protocol.
B12-D04	B12	Order management and inventory integrity	Audit trail	Required in stated format; reviewed against workstream gate and evidence protocol.
B13-D01	B13	Supplier, production, batch and quality records	Lean production/QC module	Required in stated format; reviewed against workstream gate and evidence protocol.
B13-D02	B13	Supplier, production, batch and quality records	Evidence repository	Required in stated format; reviewed against workstream gate and evidence protocol.
B13-D03	B13	Supplier, production, batch and quality records	Traceability view	Required in stated format; reviewed against workstream gate and evidence protocol.
B14-D01	B14	Shipping, fulfilment and returns integrations	Carrier/3PL adapters	Required in stated format; reviewed against workstream gate and evidence protocol.
B14-D02	B14	Shipping, fulfilment and returns integrations	Tracking service	Required in stated format; reviewed against workstream gate and evidence protocol.
B14-D03	B14	Shipping, fulfilment and returns integrations	Return module	Required in stated format; reviewed against workstream gate and evidence protocol.
B14-D04	B14	Shipping, fulfilment and returns integrations	Exception alerts	Required in stated format; reviewed against workstream gate and evidence protocol.
B15-D01	B15	Notifications and customer communication	Notification service	Required in stated format; reviewed against workstream gate and evidence protocol.
B15-D02	B15	Notifications and customer communication	Template repository	Required in stated format; reviewed against workstream gate and evidence protocol.
B15-D03	B15	Notifications and customer communication	Preference center	Required in stated format; reviewed against workstream gate and evidence protocol.
B15-D04	B15	Notifications and customer communication	Delivery logs	Required in stated format; reviewed against workstream gate and evidence protocol.
B16-D01	B16	Analytics, experimentation and business intelligence	Event schema	Required in stated format; reviewed against workstream gate and evidence protocol.

Agent execution book - no false completion without evidence

B16-D02	B16	Analytics, experimentation and business intelligence	Analytics pipeline	Required in stated format; reviewed against workstream gate and evidence protocol.
B16-D03	B16	Analytics, experimentation and business intelligence	Core dashboards	Required in stated format; reviewed against workstream gate and evidence protocol.
B16-D04	B16	Analytics, experimentation and business intelligence	Data quality tests	Required in stated format; reviewed against workstream gate and evidence protocol.
B17-D01	B17	AI product strategy, evaluation and guardrails	AI use-case register	Required in stated format; reviewed against workstream gate and evidence protocol.
B17-D02	B17	AI product strategy, evaluation and guardrails	Evaluation harness	Required in stated format; reviewed against workstream gate and evidence protocol.
B17-D03	B17	AI product strategy, evaluation and guardrails	Guardrail policy	Required in stated format; reviewed against workstream gate and evidence protocol.
B17-D04	B17	AI product strategy, evaluation and guardrails	Model/prompt versioning	Required in stated format; reviewed against workstream gate and evidence protocol.
B18-D01	B18	Cloud environments, infrastructure and secrets	Infrastructure code	Required in stated format; reviewed against workstream gate and evidence protocol.
B18-D02	B18	Cloud environments, infrastructure and secrets	Environment matrix	Required in stated format; reviewed against workstream gate and evidence protocol.
B18-D03	B18	Cloud environments, infrastructure and secrets	Secret rotation plan	Required in stated format; reviewed against workstream gate and evidence protocol.
B18-D04	B18	Cloud environments, infrastructure and secrets	Cost dashboard	Required in stated format; reviewed against workstream gate and evidence protocol.
B19-D01	B19	Security, privacy and compliance engineering	Threat model	Required in stated format; reviewed against workstream gate and evidence protocol.
B19-D02	B19	Security, privacy and compliance engineering	Record of processing inputs	Required in stated format; reviewed against workstream gate and evidence protocol.
B19-D03	B19	Security, privacy and compliance engineering	Security baseline	Required in stated format; reviewed against workstream gate and evidence protocol.
B19-D04	B19	Security, privacy and compliance engineering	Incident plan	Required in stated format; reviewed against workstream gate and evidence protocol.
B19-D05	B19	Security, privacy and compliance engineering	Privacy workflows	Required in stated format; reviewed against workstream gate and evidence protocol.
B20-D01	B20	Testing and quality engineering	Test strategy	Required in stated format; reviewed against workstream

Agent execution book - no false completion without evidence

gate and evidence protocol.

B20-D02	B20	Testing and quality engineering	Automated suites	Required in stated format; reviewed against workstream gate and evidence protocol.
B20-D03	B20	Testing and quality engineering	UAT pack	Required in stated format; reviewed against workstream gate and evidence protocol.
B20-D04	B20	Testing and quality engineering	Release quality report	Required in stated format; reviewed against workstream gate and evidence protocol.
B21-D01	B21	Deployment, release and rollback	CD pipeline	Required in stated format; reviewed against workstream gate and evidence protocol.
B21-D02	B21	Deployment, release and rollback	Release checklist	Required in stated format; reviewed against workstream gate and evidence protocol.
B21-D03	B21	Deployment, release and rollback	Migration/rollback runbook	Required in stated format; reviewed against workstream gate and evidence protocol.
B21-D04	B21	Deployment, release and rollback	Release notes	Required in stated format; reviewed against workstream gate and evidence protocol.
B22-D01	B22	Observability, incident response and platform operations	Dashboards	Required in stated format; reviewed against workstream gate and evidence protocol.
B22-D02	B22	Observability, incident response and platform operations	Alert rules	Required in stated format; reviewed against workstream gate and evidence protocol.
B22-D03	B22	Observability, incident response and platform operations	On-call/escalation plan	Required in stated format; reviewed against workstream gate and evidence protocol.
B22-D04	B22	Observability, incident response and platform operations	Backup/DR evidence	Required in stated format; reviewed against workstream gate and evidence protocol.
B22-D05	B22	Observability, incident response and platform operations	Postmortem template	Required in stated format; reviewed against workstream gate and evidence protocol.

PART I — Vision, scope and measurable success

1. Product and company vision

Build a premium fashion brand whose defensible core is the combination of credible Egyptian cotton sourcing, modern Eastern visual language, disciplined quality, transparent product data and a digital customer experience designed for Europe.

1.1 Initial market hypothesis

Dimension	Working assumption	What must validate it
Customer	Style-conscious European and diaspora customers seeking premium, culturally distinctive apparel.	Interviews, waitlist conversion, paid test campaigns and repeat purchase.
Offer	Small capsule collections: T-shirts, shirts and selected modest/elevated pieces such as modern abayas.	Sample feedback, return reasons, fit testing and margin.
Positioning	Premium accessible, not luxury theatre and not low-cost basics.	Willingness-to-pay tests and competitor price mapping.
Proof	100% cotton claims supported by supplier documents and independent tests where appropriate.	Batch traceability, fibre composition evidence and QC records.
Channel	Web-first Europe launch; mobile beta follows proven usage and retention.	Web conversion, customer requests and mobile repeat-use case.
Supply model	Manufacture and package in Egypt; import in controlled batches to an EU fulfilment point for the initial launch.	Landed-cost comparison against direct shipment per order.

Recommended launch model: Import a controlled batch into one EU fulfilment location and sell from an EU merchant entity. Direct-to-consumer shipping from Egypt for every order can create slow delivery, inconsistent duties, expensive returns and a weak customer experience. Keep it as an exception or test lane, not the default.

2. Scope boundaries by stage

Capability	PoC	Sellable MVP	Later scale
Catalog	Sample JSON data and validated SKU model.	PostgreSQL catalog, variants, content, images and availability.	Multi-market price lists, collections and product lifecycle management.
Web	Connected demo storefront.	SEO-ready responsive storefront and checkout.	Personalized merchandising, localization and experimentation.
Mobile	Expo source consuming the same API.	Closed beta or launch only when repeat-use case is proven.	Loyalty, push, saved preferences and app-only journeys.
Payments	Quote only; no live card collection.	Hosted/embedded provider checkout and verified webhooks.	Multiple methods, fraud controls, reconciliation and regional optimization.
Orders	No transaction persistence.	Idempotent order state machine, refund and return flow.	Distributed fulfilment, allocation and exception automation.
AI	Deterministic product scoring and explanation.	Search assistance and support grounded in approved data.	Size/fit models, forecasting and evaluated personalization.
ERP/WMS	Templates only.	Integrate a lean operational tool or minimal internal module.	Advanced WMS/ERP only when order volume justifies it.

Agent execution book - no false completion without evidence

3. Program-level success metrics

Area	Pilot target / question	Owner
Product	At least 80% of test users rate sample quality and fit as launch-worthy.	Product lead
Economics	Positive contribution margin after landed cost, payment, fulfilment and expected returns.	Business/finance
Data readiness	100% active SKUs pass mandatory field validation with no duplicate identifiers.	Both sides
Platform reliability	Critical user journey succeeds in staging and monitoring detects failures.	Platform lead
Customer demand	Waitlist, preorder or small launch creates evidence beyond likes and verbal praise.	Marketing lead
Operations	Every shipped item can be traced to SKU, batch, QC evidence and order.	Operations + platform
AI quality	Recommendations are relevant in evaluated scenarios and never invent unavailable products.	AI lead

PART II — Two-side operating model

Two-Side Operating Model

4. Responsibilities by side

Side A — Business/Product	Shared	Side B — Platform/Software
Customer, brand, collection, design, sourcing, production, quality, costing, pricing, compliance evidence, logistics, content, marketing and service policies.	Company strategy, roadmap, budget, risk, launch decision, analytics KPIs, legal review, incident ownership and change control.	Architecture, master-data contracts, APIs, web/mobile/admin, security, integrations, observability, analytics instrumentation, AI and release operations.

5. What the platform team can start now

Start immediately	Start with placeholders	Do not finalize yet
Repository, CI, code standards, environment strategy, API versioning, security baseline, logging, architecture decisions, product schema draft, test framework, design-token structure and PoC.	Navigation, collection model, sample products, content slots, role model, analytics taxonomy and shipping adapter interfaces.	Final UI, production checkout, VAT/customs calculations, live shipping prices, final size logic, legal copy, loyalty, forecasting, virtual try-on and warehouse automation.

6. Business-Platform Contract

This contract is the central anti-chaos mechanism. Each item has one owner, one due date, one accepted format and an acceptance rule. A Slack message saying “we will probably use cotton and Europe” is not an input.

Contract item	Accountable owner	Required input	Platform use	Acceptance
Legal and merchant model	Business	Entity name, registered address, VAT/EORI plan, merchant of record,	Checkout, invoice, tax, app-store seller and legal pages.	Approved by accountant/customs/legal advisers.

Agent execution book - no false completion without evidence

Contract item	Accountable owner	Required input	Platform use	Acceptance
		importer, invoicing identity.		
Brand system	Brand	Logo files, color/type tokens, visual rules, tone, naming conventions, asset rights.	Design system, storefront, app and campaign templates.	Versioned brand kit and approval owner.
Product taxonomy	Product	Categories, collections, target customer, attributes and lifecycle statuses.	Database, filters, navigation and analytics.	No ambiguous duplicates; examples approved.
Product master	Product/Ops	Product ID, style code, copy, fibre, origin, care, measurements, price and compliance data.	Catalog API, pages, labels and search.	Mandatory fields complete and validated.
Variant master	Product/Ops	Unique SKU, barcode plan, size, color, stock, weight and package dimensions.	Inventory, cart, shipping and fulfilment.	Every sellable unit has one unique SKU.
Pricing and cost	Finance	Currency, net/gross logic, cost stack, discount guardrails and target margin.	Price engine, promotions and reports.	Contribution margin signed off.
Market policy	Business/Legal	Countries, languages, currencies, returns, warranty, delivery promise and restricted markets.	Checkout eligibility, content and support.	Policy text reviewed and operationally possible.
Fulfilment model	Operations	Warehouse, carrier, packing process, cut-off, tracking, return address and exception handling.	OMS/carrier integration and status model.	Test shipment completed end-to-end.
Content package	Marketing	Images, alt text, videos, product copy, campaign IDs, consent and usage rights.	CMS, SEO, accessibility and analytics.	Asset manifest passes quality rules.
Analytics/KPIs	Shared	Business questions, event definitions, attribution rules and dashboard owners.	Instrumentation, warehouse and reports.	Test events reconcile to expected journey.

7. Mutual service commitments

Business side commits to	Platform side commits to
Provide approved source data, not contradictory chat instructions. Freeze launch-critical data by agreed dates. Identify decision owners and answer blocking questions. Test real operational flows, not only visual screens. Report changes through the change request process.	Publish schemas, templates and validation errors early. Make dependencies visible before coding. Provide staging previews and test evidence. Never silently invent product, tax or policy rules. Train business operators and document releases.

PART III — Governance and execution controls

8. Required roles

Role	Accountability	Side
Executive sponsor / founders	Own investment, ownership, strategic conflicts and go/no-go decisions.	Both
Program manager / product owner	Maintains roadmap, dependencies, scope and acceptance.	Shared
Brand & creative lead	Owns identity, creative direction and asset approval.	A
Product & production lead	Owns tech packs, factories, samples, QC and product master.	A
Commercial/finance lead	Owns pricing, margin, entity, tax adviser and budget.	A
Marketing & customer lead	Owns demand tests, content, lifecycle and service policy.	A
Platform architect/lead	Owns architecture, delivery, quality and technical risk.	B
Backend/data engineer	Owns domain services, database, integrations and event contracts.	B
Web/mobile engineer	Owns customer and operator interfaces.	B
Cloud/security owner	Owns environments, identity, secrets, monitoring, backup and incident readiness.	B
AI/data product owner	Owns use cases, evaluation, consent, model risk and measurable value.	B/Shared
External specialists	Legal, tax, customs, textile laboratory, accountant and data protection review.	Shared

Small-team rule: One person may hold multiple roles, but every accountability still needs an explicit name. “The team” is not an owner.

9. Meeting and decision cadence

Cadence	Participants	Purpose	Output
Weekly 45 min	Leads from both sides	Dependencies, decisions, risks and next seven days.	Updated board and blockers.
Product data clinic weekly	Product/Ops + backend	Validate new SKUs, attributes and content.	Import-ready data and error report.
Design review weekly	Brand + web/mobile	Approve tokens, components and assets.	Signed design decisions.
Sprint review biweekly	Both sides	Demo working software against acceptance criteria.	Accepted/rejected stories.
Commercial review monthly	Founders/finance/marketing/ops	Margin, demand, inventory and budget.	Scope and buying decisions.
Gate review per phase	Decision owners + specialists	Stop/go based on evidence.	Written gate decision.

10. Definition of Ready and Definition of Done

Definition of Ready — before development	Definition of Done — before acceptance
Business outcome and user identified. Acceptance criteria written. Source data owner named.	Code reviewed and tested. Security/privacy checks completed. Monitoring and error handling present.

Agent execution book - no false completion without evidence

Definition of Ready — before development	Definition of Done — before acceptance
Legal/security impact classified. Design or API contract available. Dependencies resolved or explicitly mocked. Analytics event specified.	Documentation and runbook updated. Business owner tested in staging. Analytics verified. Rollback or recovery path exists.

11. Risk register starter

Risk	Early warning	Control / response	Owner
Founder/IP dispute	Work starts without signed ownership terms.	Pause material investment; execute founders/IP agreement.	Founders
Unproven demand	Large collection or software build before paid evidence.	Capsule, waitlist, preorder or small controlled launch.	Business
Quality claim failure	Supplier cannot document fibre or batch consistency.	Incoming tests, batch records and independent lab plan.	Product
Cash trapped in inventory	MOQ exceeds validated demand.	Negotiate MOQ, split production and reorder gates.	Finance/Ops
Cross-border cost surprise	No landed-cost model or HS/origin review.	Customs broker calculation and test import.	Ops/Finance
Software overbuild	ERP/AI work while basic product data is incomplete.	Stage gates and backlog priority tied to sales evidence.	Platform
Data chaos	SKUs, prices and content differ between files.	Single source templates, validation and approval workflow.	Shared
Security/privacy breach	Production secrets or customer data in spreadsheets.	Least privilege, secrets manager, retention and audits.	Platform
Returns destroy margin	Fit complaints or return logistics unclear.	Fit testing, measurements, clear pages and EU return process.	Product/Ops
App store delay	Legal entity or organization verification not ready.	Begin organization verification before mobile release gate.	Business + mobile

PART IV — Roadmap and gates

12. Recommended program roadmap

Phase	Timing	Main work	Exit evidence
0. Founders and operating foundation	Weeks 1–2	Agreement, roles, target market hypothesis, tool accounts, decision log.	Signed operating baseline.
1. Discovery and contract	Weeks 1–4	Customer research, product taxonomy, production map, legal/import model, master-data templates.	Contract items 80% defined.
2. Product/sample and software PoC	Weeks 3–8	First sample loop, cost model and vertical-slice platform PoC.	Samples + PoC demo pass agreed scenarios.
3. Pilot readiness	Weeks 7–12	Final capsule, QC evidence, test import/fulfilment, MVP design, content plan.	Landed margin and operational flow validated.
4. Sellable web MVP	Weeks 10–22	Production catalog, checkout, orders, inventory, returns, analytics, security and legal pages.	Staging launch readiness pass.
5. Controlled launch	Weeks 23–26	Limited inventory, monitored campaigns, support and daily operations.	Real orders delivered and reconciled.
6. Mobile beta and retention	Months 7–9	Mobile account/order/wishlist journeys and push only if justified.	Repeat-use and retention evidence.
7. AI and operational scale	Months 8–12+	Search assistance, support grounding, forecasting and deeper automation.	Measured uplift versus baseline.

13. Gate criteria

Gate	Must be true	Stop or pivot when
G0 — Commit	Founder/IP agreement, named owners and spending limit.	Ownership or decision rights remain vague.
G1 — Product thesis	Customer problem, capsule and price hypothesis supported by interviews/tests.	Offer is only personal taste with no target customer evidence.
G2 — Makeability	Factory can reproduce approved sample within quality, lead time and target cost.	Sample variation or MOQ destroys economics.
G3 — Importability	Classification/origin, importer, EORI/VAT, packaging and product compliance path reviewed.	Nobody accepts importer/product-safety responsibility.
G4 — MVP build	Data contract frozen for launch scope and operational processes testable.	Products, sizes, prices or fulfilment remain unknown.
G5 — Launch	Critical path tests, legal review, monitoring, backup, support and stock reconciliation pass.	Payment/order/return flow cannot be recovered manually.
G6 — Scale	Demand, repeat rate and contribution margin justify more inventory/features.	Growth hides negative unit economics or high returns.

14. First 30 / 60 / 90 days

Period	Side A priorities	Side B priorities	Joint outcome
Days 1–30	Founder agreement; customer interviews; brand brief; first capsule; factory shortlist; product/variant templates; legal/import adviser.	PoC run; repo/CI; architecture decisions; schemas; environments; staging plan; analytics draft.	Approved hypothesis, owners, templates and visible PoC.
Days 31–60	Tech packs; samples; costing; QC checklist; size testing; content shot list; fulfilment comparison.	PostgreSQL design; production API; design system; storefront skeleton; admin import; security baseline.	Sample feedback and MVP backlog linked to real data.
Days 61–90	Final pilot SKUs; test batch; packaging/label evidence; test import; campaign/waitlist; support policy.	Catalog/admin staging; checkout sandbox; order state machine; observability; end-to-end tests.	Pilot readiness review with landed margin and staging purchase flow.

PART VI — SIDE B walkthrough: Platform, Software, AI and Applications

Side B builds a modular commerce platform, but the order matters. Reliability, data integrity and operations precede impressive AI demos.

B1. Technical governance and architecture decisions

Owner: Platform lead. Create a controlled engineering system and make trade-offs visible.

Prerequisites	Execution	Deliverables
• Named technical owner • Business roadmap and risk tolerance	• Create architecture decision records, coding standards, branching/review policy and semantic versioning • Define build-vs-buy criteria • Establish nonfunctional requirements and supported regions • Create dependency and license inventory	• Engineering handbook • ADR log • Nonfunctional requirements • Technology radar

Required from the other side	What this workstream returns	Recommended tools
• Business priorities, volume assumptions and account ownership	• Capability options, cost/risk implications and technical constraints	• GitHub • Issue tracker • ADR template • Dependency scanning

Gate to continue: Architecture choices link to business constraints and have revisit triggers.

B2. Repository, developer setup and CI

Owner: Platform/DevOps. Make onboarding and validation reproducible from the first commit.

Prerequisites	Execution	Deliverables
• Source-code ownership and access roles	• Create monorepo or clearly versioned repos • Add environment examples, formatting, linting, tests and commit checks • Protect main branch and require review • Build CI for backend, web and mobile • Generate software bill of materials and dependency updates	• Repository baseline • README/runbook • CI pipelines • Access policy

Required from the other side	What this workstream returns	Recommended tools
• Company accounts and authorized developers	• Setup instructions, release evidence and access list	• GitHub • GitHub Actions • Docker • Pre-commit/hooks • Renovate/Dependabot

Gate to continue: A new developer can clone, configure, test and run the PoC without tribal knowledge.

B3. Domain model and master-data contracts

Owner: Backend/data lead. Translate business truth into stable identifiers, validation and lifecycle rules.

Agent execution book - no false completion without evidence

Prerequisites	Execution	Deliverables
Draft product/variant/supplier/order processes	- Model product, variant, SKU, collection, price, inventory location, batch, supplier, order, shipment, return and evidence - Define required/optional fields, enums and state transitions - Separate immutable IDs from display names - Version schemas and migration rules - Create import validators and error reports	- ER/domain model - JSON/OpenAPI schemas - CSV templates - Validation service

Required from the other side	What this workstream returns	Recommended tools
Approved taxonomy, policies, tech-pack and operational fields	Clear data requirements, errors and preview of imported records	- PostgreSQL design tools - Pydantic/JSON Schema - OpenAPI - Migration framework

Gate to continue: A representative capsule imports with unique SKUs and no unresolved mandatory fields.

B4. API design and integration contracts

Owner: Backend lead. Provide stable versioned contracts for web, mobile, admin and partners.

Prerequisites	Execution	Deliverables
Domain model and channel use cases	- Design REST/event APIs, pagination, filtering and error format - Define idempotency for payment/order operations - Use webhooks with signatures and retries - Publish OpenAPI and mock server - Set compatibility/deprecation policy	- OpenAPI specification - Webhook contracts - Error catalogue - API test suite

Required from the other side	What this workstream returns	Recommended tools
Business workflows, partner capabilities and status vocabulary	Integration limitations, required credentials and sandbox instructions	- FastAPI - OpenAPI tooling - Contract tests - API client collection

Gate to continue: Web/mobile/admin can develop against mocks and contract tests pass.

B5. Identity, roles and access control

Owner: Security/backend lead. Keep customer, operator and service access separate and least-privileged.

Prerequisites	Execution	Deliverables
Legal roles and operational responsibilities	- Choose identity provider or implement verified flows - Model customer, support, catalog, warehouse, finance and administrator permissions - Require MFA for privileged access - Create session/token, recovery, offboarding and audit policies - Test authorization server-side	- RBAC matrix - Auth flows - MFA/admin policy - Audit events

Agent execution book - no false completion without evidence

Required from the other side	What this workstream returns	Recommended tools
Named roles, approval limits and support responsibilities	Access request/offboarding process and permission boundaries	- Managed identity provider or secure library - Password manager - Audit log

Gate to continue: Privilege tests prove users cannot access data or actions outside their role.

B6. Design system and front-end foundation

Owner: Web/mobile lead. Turn brand assets into accessible reusable components across channels.

Prerequisites	Execution	Deliverables
Brand tokens and content direction	- Implement colors, type, spacing, components and responsive breakpoints - Create accessibility states, error/empty/loading patterns - Document components and content constraints - Support localization and right-to-left readiness where required - Build visual regression checks	- Component library - Token package - Storybook/catalog - Accessibility checklist

Required from the other side	What this workstream returns	Recommended tools
Approved assets, copy patterns and imagery	Interactive preview, asset rules and design constraints	- Figma - Storybook or equivalent - Automated accessibility tests

Gate to continue: Core components meet accessibility and render consistently on target devices.

B7. Catalog, content and media platform

Owner: Backend/web lead. Create one authoritative product experience across web and mobile.

Prerequisites	Execution	Deliverables
Product master and asset manifest	- Persist products, variants, collections and localized content - Create admin import/edit/review workflow - Store images in object storage and serve optimized variants via CDN - Support draft/scheduled/active/archived states - Record approvals and audit changes	- Catalog service - CMS/admin workflow - Media pipeline - Preview environment

Required from the other side	What this workstream returns	Recommended tools
Approved product data, media, locales and launch schedule	Validation reports, previews and missing-content dashboard	- PostgreSQL - Object storage/CDN - Headless CMS optional - Image processing

Gate to continue: Business owner can publish a complete product without a developer editing code.

B8. Search, filters and merchandising

Owner: Web/data lead. Help customers find real in-stock products using the business taxonomy.

Prerequisites	Execution	Deliverables
Catalog attributes and customer vocabulary	- Implement filters for category, size, color, price, collection and availability - Add typo tolerance/synonyms only from approved terms - Create merchandising rules and no-result reporting - Instrument searches and clicks - Keep ranking explainable before AI	- Search service - Filter API - Merchandising controls - Search analytics

Required from the other side	What this workstream returns	Recommended tools
Synonyms, product priorities and campaign rules	No-result terms, demand insights and rule controls	- Database search first; Meilisearch/OpenSearch when needed - Analytics

Gate to continue: Search evaluation set returns relevant available products with acceptable latency.

B9. Web storefront and SEO

Owner: Web lead. Deliver the main acquisition and purchase channel before relying on an app.

Prerequisites	Execution	Deliverables
Design system, catalog APIs, legal content and checkout plan	- Build home, collection, product, search, cart, account/order and support pages - Implement performance budgets, structured data, metadata and canonical rules - Support consent, localization and accessibility - Use server rendering/static strategies appropriate to content - Test core web vitals and browser matrix	- Production storefront - SEO controls - Consent integration - Web test suite

Required from the other side	What this workstream returns	Recommended tools
Content, countries, shipping/returns and campaign needs	Preview links, content limits and analytics	- Next.js or comparable framework - TypeScript - Automated browser tests - CDN

Gate to continue: Critical browse-to-checkout journey passes functional, accessibility and performance thresholds.

B10. Mobile application strategy and implementation

Owner: Mobile lead. Build mobile around repeat value, not merely duplicate the website.

Prerequisites	Execution	Deliverables
- Organization/legal entity for store accounts - Proven mobile use cases	- Define account, order tracking, wishlist, saved preferences and push use cases - Share API/types/design tokens where practical - Implement secure storage, deep links, analytics and crash reporting - Prepare privacy labels/data safety	- Expo/React Native app - Build/submission profiles - TestFlight/Play testing release - Store metadata

Agent execution book - no false completion without evidence

Prerequisites	Execution	Deliverables
	disclosures • Use internal distribution and store test tracks	

Required from the other side	What this workstream returns	Recommended tools
• App name/assets, seller identity, privacy/support URLs and release content	• Installable builds, app-store prerequisites and test feedback	• React Native with Expo/EAS • Crash monitoring • Device testing

Gate to continue: Mobile beta proves a repeat-use benefit and meets store/account requirements.

B11. Cart, checkout and payments

Owner: Backend/web lead. Accept payment without taking unnecessary card-data security scope.

Prerequisites	Execution	Deliverables
• Merchant entity, prices, tax and policy inputs	• Implement server-authoritative cart and price validation • Create hosted/embedded payment sessions • Verify signed webhooks and idempotently create orders • Handle pending, failed, authorized, captured, refunded and disputed states • Reconcile provider events and payouts • Never trust client totals	• Checkout integration • Payment state machine • Webhook processor • Reconciliation export

Required from the other side	What this workstream returns	Recommended tools
• Merchant/payment account, currencies, methods, refund and fraud rules	• Sandbox scenarios, operational alerts and reconciliation fields	• Stripe Checkout or selected PSP • Secrets manager • Webhook test CLI

Gate to continue: Duplicate webhooks and retries cannot duplicate orders or refunds; raw card data never hits platform servers.

B12. Order management and inventory integrity

Owner: Backend/operations lead. Make order and stock states explicit, recoverable and auditable.

Prerequisites	Execution	Deliverables
• SKU/location model, payment and fulfilment flow	• Create order state machine and event history • Reserve/release stock atomically • Support cancellation, partial fulfilment, return and refund mappings • Create operator views and manual recovery actions • Audit every inventory adjustment	• OMS service • Inventory ledger • Admin exception queue • Audit trail

Required from the other side	What this workstream returns	Recommended tools
• Warehouse statuses, allocation rules and authority limits	• Accurate stock views, exception handling and training	• PostgreSQL transactions • Queue/outbox pattern • Admin UI

Agent execution book - no false completion without evidence

Gate to continue: Concurrency tests prevent overselling and every stock difference has a traceable reason.

B13. Supplier, production, batch and quality records

Owner: Backend/admin lead. Digitize only the controls needed for traceability and launch operations.

Prerequisites	Execution	Deliverables
Supplier/QC process and evidence requirements	- Create supplier, purchase/production order, material lot, production batch, inspection and release entities - Attach controlled documents/photos - Notify overdue samples/inspections - Expose traceability from SKU to batch and evidence - Avoid factory IoT/digital twin until justified	- Lean production/QC module - Evidence repository - Traceability view

Required from the other side	What this workstream returns	Recommended tools
Factory/SOP fields, statuses and documents	Forms, validation, reminders and traceability report	- Admin web app - Object storage - Workflow rules

Gate to continue: A shipped SKU can be traced to supplier, batch and release evidence in minutes.

B14. Shipping, fulfilment and returns integrations

Owner: Backend/operations lead. Connect carriers/3PL while preserving an internal source of truth.

Prerequisites	Execution	Deliverables
Carrier/3PL choice and SOP	- Build adapter interfaces for rates, labels, tracking and cancellation - Map external statuses to internal events - Process webhooks with retry/dead-letter handling - Generate return authorization and inspection workflow - Provide fallback manual label/status path	- Carrier/3PL adapters - Tracking service - Return module - Exception alerts

Required from the other side	What this workstream returns	Recommended tools
Credentials, service levels, package data and status mappings	Integration test results, outage fallback and dashboards	- Carrier APIs - Webhook queue - Admin console

Gate to continue: Test shipment and return update order, inventory, customer communication and finance correctly.

B15. Notifications and customer communication

Owner: Backend/customer lead. Send transactional messages reliably and with correct consent separation.

Prerequisites	Execution	Deliverables
Approved templates and lifecycle events	- Separate transactional from marketing consent - Version email/push templates and	- Notification service - Template repository - Preference center

Agent execution book - no false completion without evidence

Prerequisites	Execution	Deliverables
	localization • Create event-driven sends with retry and suppression • Protect sensitive data in messages • Track delivery/bounce without over-collecting	• Delivery logs

Required from the other side	What this workstream returns	Recommended tools
• Approved copy, languages, sender domains and escalation contacts	• Preview/test tools and delivery metrics	• Email provider • Push service • Domain authentication

Gate to continue: All critical order scenarios send correct, localized and testable communication.

B16. Analytics, experimentation and business intelligence

Owner: Data/platform lead. Create trustworthy decision data instead of incompatible dashboard numbers.

Prerequisites	Execution	Deliverables
• KPI definitions and consent requirements	• Define event dictionary and IDs • Instrument server and client events • Implement consent-aware analytics • Create source-of-truth order/revenue model • Build funnel, product, inventory, returns and campaign dashboards • Reconcile analytics to transactional data	• Event schema • Analytics pipeline • Core dashboards • Data quality tests

Required from the other side	What this workstream returns	Recommended tools
• Questions, campaign metadata, margin inputs and owners	• Actionable dashboards and data-quality alerts	• PostHog/GA or chosen analytics • Warehouse/BI when justified • dbt-style tests

Gate to continue: Order and revenue reports reconcile within defined tolerance; events are documented and owned.

B17. AI product strategy, evaluation and guardrails

Owner: AI/data product lead. Use AI only where data, evaluation and business value exist.

Prerequisites	Execution	Deliverables
• Catalog/search/support data • Consent and privacy decisions	• Prioritize use cases by value/risk/data readiness • Create offline evaluation sets and baseline • Ground outputs in approved catalog/knowledge • Prevent unavailable product hallucination • Record model/version/prompt and feedback • Provide deterministic fallback and human escalation • Complete impact/privacy review for image/body features	• AI use-case register • Evaluation harness • Guardrail policy • Model/prompt versioning

Required from the other side	What this workstream returns	Recommended tools
• Approved knowledge, brand voice, exclusions and escalation rules	• Measured quality reports, failure examples and operator controls	• Python evaluation suite • Vector/search tools if justified • LLM provider abstraction

Gate to continue: AI beats the non-AI baseline on defined metrics and failures are observable/recoverable.

B18. Cloud environments, infrastructure and secrets

Owner: Cloud/DevOps lead. Run dev, staging and production predictably with controlled access.

Prerequisites	Execution	Deliverables
• Budget, regions and data residency requirements	• Define accounts/projects, network and environment separation • Provision database, storage, CDN, compute, queues and secrets as code • Use managed services before Kubernetes • Encrypt in transit/at rest • Set budget alerts, tags and ownership • Document local and disaster recovery	• Infrastructure code • Environment matrix • Secret rotation plan • Cost dashboard

Required from the other side	What this workstream returns	Recommended tools
• Company billing/account owners and expected scale	• Costs, access requirements and recovery objectives	• Terraform/OpenTofu optional • Managed cloud services • Docker • Secrets manager

Gate to continue: Staging can be recreated and production secrets are absent from code and developer laptops.

B19. Security, privacy and compliance engineering

Owner: Security/platform lead. Embed controls into design and operation rather than add a privacy page at the end.

Prerequisites	Execution	Deliverables
• Data inventory and legal/compliance review	• Threat model payments, accounts, admin, supply chain and integrations • Apply least privilege, MFA, secure headers, dependency scanning and rate limits • Define personal-data purpose, retention, deletion/export and processors • Implement consent and cookie controls • Create incident and breach response • Run vulnerability and backup-restore tests	• Threat model • Record of processing inputs • Security baseline • Incident plan • Privacy workflows

Required from the other side	What this workstream returns	Recommended tools
• Lawful purposes, retention, support and legal contact decisions	• Risk findings, required policy language and operator duties	• OWASP guidance • SAST/dependency scanning • WAF/rate limits • DPA register

Gate to continue: High risks have owners; data rights and recovery are tested, not only documented.

B20. Testing and quality engineering

Owner: QA/engineering leads. Prove the critical business journey and failure recovery before launch.

Prerequisites	Execution	Deliverables
Acceptance criteria and representative data	- Create unit, integration, contract, end-to-end, accessibility, performance and security tests - Test payment/carrier webhook retries, stock races, refunds and partial failures - Maintain device/browser matrix - Use staging data that contains no real unnecessary personal data - Run business UAT with scripts	- Test strategy - Automated suites - UAT pack - Release quality report

Required from the other side	What this workstream returns	Recommended tools
Real scenarios, policies, sample devices and acceptance owners	Defects, evidence and release recommendation	- Pytest - Browser automation - API contract tests - Mobile testing - Load/security tools

Gate to continue: All launch-critical scenarios pass or have explicit accepted risk and manual recovery.

B21. Deployment, release and rollback

Owner: DevOps/platform lead. Release small, observable and reversible changes.

Prerequisites	Execution	Deliverables
Stable CI, environments and test suite	- Build signed/versioned artifacts - Use database migration discipline - Promote through staging with approval - Run smoke tests and canary/feature flags where useful - Document rollback and data-forward-fix strategy - Freeze launch-critical changes	- CD pipeline - Release checklist - Migration/rollback runbook - Release notes

Required from the other side	What this workstream returns	Recommended tools
Business release windows and content freeze	Deployment visibility, training notes and risk summary	- GitHub Actions - Container registry - Feature flags optional - Monitoring

Gate to continue: A release and rollback rehearsal succeeds without losing orders or inventory data.

B22. Observability, incident response and platform operations

Owner: Cloud/platform lead. Detect customer-impacting failures before social media does.

Prerequisites	Execution	Deliverables
Service map and business severity definitions	- Instrument logs, metrics, traces and business events - Create alerts for payment/order/inventory/carrier and error-rate anomalies - Define incident roles, communication	- Dashboards - Alert rules - On-call/escalation plan - Backup/DR evidence - Postmortem template

Agent execution book - no false completion without evidence

Prerequisites	Execution	Deliverables
	and status updates • Back up and test restore • Track SLOs, capacity and costs • Run post-incident reviews without blame	
Required from the other side	What this workstream returns	Recommended tools
• Operational hours, severity and customer communication owners	• Health visibility, incidents and improvement actions	• Sentry or equivalent • Metrics/logging stack • Status communication

Gate to continue: A simulated critical incident is detected, owned, communicated and recovered within target time.

PART VII — Proof of Concept package

15. PoC objective and success criteria

The accompanying repository is a vertical slice, not a production store. Its purpose is to prove the cross-team contract: one structured product master drives web, mobile, inventory visibility, a quote and an AI-style recommendation.

PoC scenario	Evidence
Catalog connection	Three sample products load from the API into the web storefront.
Variant/SKU integrity	Nine unique SKU records validate against the schema.
Shared channel API	The Expo mobile source consumes the same product endpoint.
AI pattern	A deterministic recommender ranks only active in-budget products and explains the selection.
Operational API	Quote endpoint verifies SKU and stock and returns a transparent PoC total.
Engineering baseline	Docker Compose, API documentation, tests and GitHub Actions are included.

16. Repository structure

Path	Purpose
backend/app	FastAPI routes, validation schemas, catalog repository and deterministic stylist.
backend/data/products.json	Sample product/variant master used by the PoC.
backend/tests	Health, catalog, recommendation and quote tests.
storefront	Responsive static storefront connected to the API.
mobile	Expo/React Native source connected to the same API.
docs	Product, variant and asset templates plus decision/handoff checklists.
scripts	Product data validator.
docker-compose.yml	Runs API and storefront locally.
.github/workflows	Backend CI test workflow.

17. PoC setup and demo

1. Install Docker Desktop or Docker Engine with the Compose plugin.
2. Extract the PoC package and copy `.env.example` to `.env`.
3. Change `ADMIN_API_TOKEN` before sharing the environment.
4. Run: `docker compose up --build`
5. Open the storefront at `http://localhost:3000` and API documentation at `http://localhost:8000/docs`.
6. Demonstrate catalog, stock, stylist and quote scenarios using the README demo script.
7. For mobile, set `EXPO_PUBLIC_API_BASE` for emulator/phone, install dependencies and run `npx expo start`.

PoC limitation: It does not collect live payment, calculate VAT/customs, persist transactional orders, reserve inventory atomically, print carrier labels or contain final legal text. Exposing it as a live shop would be irresponsible.

18. Production migration map

PoC shortcut	Production replacement	Dependency from Side A
JSON catalog	PostgreSQL, migrations, admin workflow and audit history.	Approved master-data fields and lifecycle.
Static storefront	SEO/performance-tested web application and CMS preview.	Final tokens, content, policies and locales.
Quote endpoint	Server-authoritative cart, tax/shipping and payment session.	Merchant/import/tax and fulfilment model.
Stock number in JSON	Inventory ledger, reservations, locations and adjustments.	Warehouse process, opening stock and authority limits.
Rule-based stylist	Evaluated search/ranking/LLM explanation with fallback.	Approved tags, use cases, exclusions and evaluation examples.
No auth	Managed/secure customer identity, RBAC, MFA and audit.	Operational roles and privacy decisions.
Local Docker	Staging/production cloud, secrets, monitoring, backups and CI/CD.	Billing owner, budget, legal data location and support hours.

PART VIII — Architecture, data, security, compliance and deployment

Target Architecture — staged, not all built on day one

19. Architecture principles

- Web-first launch; mobile is a separate value decision, not a vanity requirement.
- Modular monolith before microservices. Split only where team scale, reliability or load provides evidence.
- Managed services before Kubernetes. Operational complexity is a cost, not a badge.
- Provider-hosted/tokenized payment UI; never build card handling from scratch.
- PostgreSQL is the transactional source of truth; analytics copies do not drive order state.
- Events/webhooks are idempotent, signed, observable and replayable.
- Every external integration has an adapter, timeout, retry policy, dead-letter path and manual fallback.
- AI is an optional decision layer over approved data; it does not own price, stock or legal facts.

20. Core data entities and ownership

Entity	Key fields	Business owner	Technical control
Product	Immutable ID, style code, name, category, collection, composition, origin, care, status.	Product	Schema, validation, version/audit.
Variant	SKU, barcode, size, color, dimensions, weight, status.	Product/Ops	Uniqueness and referential integrity.
Price	Market, currency, net/gross, validity, tax class, approval.	Finance	Server-authoritative calculation and history.
Inventory ledger	SKU, location, quantity delta, reason, reference, timestamp.	Operations	Transactional append-only movement.

Agent execution book - no false completion without evidence

Entity	Key fields	Business owner	Technical control
Supplier/batch	Supplier, material lot, production order, inspection and release.	Sourcing/QC	Evidence links, statuses and audit.
Customer/account	Identity, contact, preferences and consent.	Customer/legal	Minimization, security and rights workflows.
Order/payment	Items, amounts, state, provider references and event history.	Operations/finance	Idempotency and immutable audit trail.
Shipment/return	Carrier, tracking, events, reasons, condition and refund mapping.	Operations	External mapping and exceptions.
Content/asset	Locale, rights, alt text, approvals, product mapping.	Brand/marketing	CDN, versioning and access.
Analytics event	Anonymous/user ID policy, event, properties, consent and source.	Shared	Schema validation and retention.

21. Product master mandatory fields

Group	Required launch fields
Identity	product_id, style_code, product_name, slug, collection, category, lifecycle_status
Commercial	retail_price, currency, tax class, launch date, market eligibility
Material/compliance	fibre composition, country of origin, care, compliance/evidence IDs, responsible/importer data where required
Content	short/long description, fit, measurements, SEO title/description, locale, approved claims
Variant	SKU, barcode decision, size, color, dimensions, weight, opening stock, reorder point
Operations	supplier, production batch, warehouse/location, package type/dimensions, QC release
Media	primary/listing/detail images, alt text, rights owner and approval/version

22. Security and privacy minimum baseline

- MFA for cloud, source control, payment, email, analytics and admin accounts.
- Separate individual accounts; no shared founder password.
- Production secrets in a managed secret store; never in repositories, screenshots or chat.
- Server-side authorization on every privileged action and audit logs for price, stock, refund and user-role changes.
- Personal-data inventory with purpose, lawful basis, processor, retention and deletion/export procedure.
- Consent-aware analytics and marketing; nonessential cookies remain off until valid consent where required.
- Encrypted transport, database backups, restore tests, dependency updates, rate limiting and security headers.
- Incident plan that covers customer communication, payment provider, processors and data authority/legal escalation.

23. EU/Germany compliance baseline for the plan

The final obligations depend on the legal entity, product, claims, target countries and fulfilment model. The following items are planning controls that require professional confirmation before launch.

Control area	Planning requirement	Refs
General Product Safety Regulation (GPSR)	Applies to consumer products sold online/offline in the EU from 13 December	[R1][R2]

Agent execution book - no false completion without evidence

Control area	Planning requirement	Refs
	2024; define manufacturer/importer/responsible economic operator, traceability, safety information and recall handling.	
Textile fibre labelling	EU textile products must show fibre composition using permitted fibre names; labels/markings must be firmly attached and language requirements depend on sale country.	[R3][R4]
Chemical restrictions (REACH)	Supplier declarations and risk-based testing should cover restricted substances; clothing/textiles are subject to specific restrictions including entry 72 CMR substances.	[R5]
Distance-selling consumer rights	Online consumers generally have a 14-day withdrawal period; pre-contract information and a workable return/refund process are required, subject to exceptions.	[R6][R7]
GDPR and ePrivacy/cookies	GDPR applies to EU-targeted processing; document purpose/lawful basis, rights, processors, security and retention. Some cookies require prior consent.	[R8][R9]
VAT OSS/IOSS	OSS can simplify cross-border EU B2C VAT reporting; IOSS is designed for qualifying imported consignments up to EUR 150. Model depends on stock location and seller/importer.	[R10][R11]
Customs/EORI and origin	An EU importer normally needs customs readiness including EORI; tariff preference requires correct classification and proof that origin rules are met.	[R12][R13][R14]
Germany packaging law	Businesses placing packaged goods on the German market may need LUCID registration, system participation and volume reporting, including online retailers/importers.	[R15]
App-store organization identity	Apple organization enrollment requires legal entity status and normally a D-U-N-S number; Google Play organization accounts require verified organization/contact information.	[R16][R17]
Payment card scope	Use low-risk provider-hosted/tokenized payment integration so card details go directly to the provider; PCI remains a shared responsibility.	[R18][R19]

24. Deployment environments

Environment	Purpose	Data rule	Access
Local	Developer work and unit tests.	Synthetic/sample data only.	Individual developer.
Development	Shared integration and early demos.	Synthetic; resettable.	Engineering.
Staging	Release candidate, UAT and sandbox integrations.	Masked/synthetic; no unnecessary real customer data.	Engineering + selected business testers.
Production	Real customers and operations.	Minimized real data with retention controls.	Least privilege, MFA and audit.

Agent execution book - no false completion without evidence

Environment	Purpose	Data rule	Access
Analytics	Reporting/experiments.	Pseudonymized/minimized according to purpose/consent.	Data roles only.

25. Production deployment runbook

1. Confirm gate approval, change freeze, release owner and communication channel.
2. Verify automated tests, dependency/security scan, database migration review and backup.
3. Deploy to staging; execute smoke, payment sandbox, order, inventory, carrier and return scenarios.
4. Obtain business UAT sign-off and confirm product/content freeze.
5. Create versioned production artifact; apply migration with observed checkpoints.
6. Deploy behind feature flag/canary when appropriate; run production smoke without creating uncontrolled orders.
7. Monitor errors, payment webhooks, order creation, stock, carrier events and customer messages.
8. Rollback or forward-fix according to data state; do not improvise destructive database reversals.
9. Publish release notes, update runbooks and record metrics/incidents.

PART IX — Launch, operations, capacity, checklists and templates

26. Launch readiness checklist

- ☐ Founder/IP/company and account ownership documented.
- ☐ Merchant/importer, VAT/EORI/customs and invoice model reviewed.
- ☐ Products classified; fibre/origin/care/traceability data complete.
- ☐ Production batch released with QC evidence and opening inventory reconciled.
- ☐ Packaging/labels physically checked against approved data.
- ☐ Product content, image rights, alt text and translations approved.
- ☐ Shipping and return tests completed with real packages.
- ☐ Payment success, failure, retry, duplicate webhook, refund and dispute paths tested.
- ☐ Stock concurrency, cancellation, partial fulfilment and return paths tested.
- ☐ Legal pages, consent and privacy rights workflows reviewed.
- ☐ Monitoring, alerting, backup restore and incident simulation passed.
- ☐ Support staff trained with order lookup and escalation.
- ☐ Finance can reconcile a test order from checkout to bank and stock.
- ☐ Campaign tracking and analytics reconcile to transactional orders.
- ☐ Rollback, launch freeze and decision authority confirmed.

27. Capacity and budget model

Do not use a single fantasy budget. Build a capacity model by stage and compare internal time with direct cash. The largest early costs are usually product development, minimum production, content, compliance/import, fulfilment setup and marketing—not cloud hosting.

Cost block	Planning driver	Control
Founder/legal/company	Entity structure, agreements, trademark and advisers.	Fixed approval budget before work.
Product development	Number of styles × sample rounds × materials/printing.	Capsule limit and sample gate.
Production/inventory	MOQ × unit cost + defects + buffer.	Split runs and reorder triggers.
Testing/compliance	Material risk, lab scope, markets and claims.	Risk-based plan; retain evidence.
Freight/customs/fulfilment	Weight, volume, lane, incoterm, duty/origin, storage and returns.	Test shipment and landed-cost model.
Content/marketing	Products, shoot scope, creators, media and lifecycle.	Experiment budgets and stop-loss.
Software/cloud	People time, providers, environments, observability and support.	MVP capability map; managed services.
Contingency	Delay, resample, customs, defects, returns and platform incidents.	Separate reserve; not spent on nice-to-have features.

28. Recommended minimum team capacity

Stage	Side A minimum	Side B minimum
PoC / discovery	Business/product lead, brand/designer, sourcing/ops part-time, finance/legal	One strong full-stack/platform lead; design support; security/cloud review.

Agent execution book - no false completion without evidence

Stage	Side A minimum	Side B minimum
	specialists.	
MVP build	Product/ops owner, brand/content, marketing/customer, finance/operations.	Backend, web/full-stack, part-time mobile, cloud/security and QA responsibility.
Launch	Daily operations/support, inventory/fulfilment and campaign owner.	Release/on-call owner, backend/web support and monitoring.
Scale	Dedicated product/production, marketing/CRM, finance and customer operations.	Domain engineers, data/AI, mobile, platform/SRE and QA based on demand.

29. Weekly cross-team status template

Field	Required content
Outcome this week	Measurable result, not activity list.
Decisions needed	Decision, owner, options, deadline and cost of delay.
Inputs due from Side A	Artifact, format, owner, due date and acceptance status.
Inputs due from Side B	Preview/schema/tool/report, owner and due date.
Risks/blockers	Probability, impact, response and escalation date.
Metrics	Demand, product/sample, data quality, delivery and budget signals.
Next seven days	Maximum three priorities per side.

30. Change request template

Field	Example
Requested change	Add a new “one size” variant model for selected abayas.
Business reason	Approved product construction does not use S/M/L.
Affected data/process	Variant schema, size filter, PDP, warehouse label, analytics.
Requested by / date	Named owner and target launch.
Options	Generic size string / category-specific sizes / new size-system entity.
Impact estimate	Design, engineering, data migration, testing, operations and delay.
Decision and approver	Selected option with rationale.
Acceptance test	Product imports, displays, filters, orders and fulfils correctly.

31. Factory onboarding checklist

- ☐ Legal identity, address, contacts, bank and tax documents verified.
- ☐ Capability, capacity, equipment and subcontracting disclosed.
- ☐ NDA/manufacturing/IP/quality terms signed.
- ☐ Material supplier and traceability process documented.
- ☐ MOQ, lead times, payment milestones and capacity reservation agreed.
- ☐ Tech-pack receipt/version control and sample approval process tested.
- ☐ QC, defect remedies, batch release and corrective action agreed.
- ☐ Restricted-substance declarations and evidence requirements accepted.
- ☐ Packaging/label specifications and barcode process tested.
- ☐ Backup/continuity and change-notification contacts assigned.

32. Product onboarding checklist

- ☐ Product/style ID and unique variant SKUs assigned.
- ☐ Approved tech pack, size chart and sample version linked.
- ☐ Composition, origin, care, weight, dimensions and evidence completed.
- ☐ Cost, landed cost, price, tax class and market eligibility approved.
- ☐ Supplier, batch, QC release and opening inventory recorded.
- ☐ Images, alt text, copy, SEO and rights approved for each locale.
- ☐ Packaging/label data and barcode/QR verified physically.
- ☐ Search attributes, style tags and collection navigation approved.
- ☐ Returns/fit guidance and customer service knowledge added.
- ☐ Staging page and test order accepted by business owner.

33. App-store release prerequisite checklist

- ☐ Organization legal entity and public website established.
- ☐ Apple organization enrollment information/D-U-N-S path completed where applicable.
- ☐ Google Play organization and contact verification completed.
- ☐ Bundle/package identifiers owned by the company.
- ☐ Privacy policy, support URL, contact and data disclosures approved.
- ☐ App screenshots, description, category, age/content rating and reviewer notes prepared.
- ☐ Production API, account deletion/data rights and crash monitoring tested.
- ☐ Internal testing and staged rollout plan approved.
- ☐ Store credentials held in company-controlled password/secret management.

34. Final execution order

Week one action: Sign the operating/IP baseline, appoint owners, run the PoC, and issue the product/variant/factory data templates. Do not start polishing a homepage before those actions.

1. Side A completes A1–A4 and starts A5–A8.
2. Side B completes B1–B4 and runs the provided PoC.
3. Both sides hold the first product-data clinic and populate one real style end-to-end.
4. Side A validates sample, factory, landed cost, importer/compliance and fulfilment.
5. Side B builds the sellable MVP only for the approved capsule and markets.
6. Both sides execute a real test import, test order, shipment, return, refund and reconciliation.
7. Launch small, observe daily and scale only after contribution margin and customer evidence.

APPENDIX — Current reference baseline

Sources were checked for the 1 August 2026 planning baseline. Always re-check official requirements before launch because laws, guidance and platform processes change.

SYSTEM PROMPT - FASHION COMMERCE PLATFORM SIDE B AGENT

Identity and accountability

You are the sole expert agent responsible for the Platform, Software, AI, Mobile, Cloud and Engineering Lead side of the Fashion Commerce Platform. Act as the accountable program owner, expert practitioner, project manager, artifact creator, reviewer and verifier for your complete side. You do not merely advise. You create the required deliverables, test what can be tested, manage dependencies, expose blockers and correct failed work until the launch gate is honestly satisfied.

Case study

The company will launch premium clothing manufactured and packaged in Egypt, using evidence-backed Egyptian cotton and quality claims and a modern Eastern design identity, sold primarily to European customers. Two expert agents work together:

- Side A: Business, Product, Brand and Marketing.
- Side B: Platform, Software, AI and Applications.

You are Side B. The other side is the Side A Business/Product/Brand/Marketing agent.

Mission

Completely plan, build, document and verify architecture, repositories, data/domain contracts, backend APIs, admin, web, mobile, payments, inventory/orders, supplier/QC records, shipping/returns integrations, communication, analytics, AI, infrastructure, security, testing, deployment and operations. Execute the work packages B1-B22 in the attached Side B Agent Book, use its exact deliveries and gates, and produce a market-deployment-readiness dossier. Prioritize a narrow, correct, sellable MVP and one real product vertical slice before broad catalog, enterprise automation or impressive AI features.

Non-negotiable truth rules

1. Never claim completion without an artifact, acceptance criteria and evidence.
2. Use only these evidence statuses: DRAFT, SELF-VALIDATED, AUTOMATED-TESTED, HUMAN-VERIFIED, EXTERNALLY-VERIFIED, BLOCKED, REJECTED.
3. Never fabricate customer interviews, factory visits, sample inspections, test reports, certificates, contracts, legal/tax/customs advice, registrations, payment activation, carrier results, real orders, production metrics or app-store approval.
4. For human/external actions, prepare the full dossier, instructions, questions and acceptance checklist, then keep the item pending until evidence arrives.
5. Do not stop for non-blocking uncertainty. Record a reversible assumption, isolate it and continue safe work. Raise a blocker only when continuing creates legal/safety risk, corrupts source truth or creates material rework.
6. Verify current laws, standards, provider rules, product APIs and software versions from official primary sources at execution time and record the source/date.
7. Never silently invent or overwrite the other side's source-of-truth decisions.

Agent execution book - no false completion without evidence

8. Do not hide failed tests, accepted risks or contradictions.

Mandatory operating workspace

Create and continuously maintain:

- PROGRAM_CHARTER.md
- DELIVERABLE_REGISTER.csv
- DECISION_LOG.md
- ASSUMPTION_REGISTER.csv
- DEPENDENCY_REGISTER.csv
- RISK_REGISTER.csv
- EVIDENCE_INDEX.csv
- STATUS_REPORT.md
- /work_packages/side_b
- /handoffs/incoming and /handoffs/outgoing
- /evidence/side_b

DELIVERABLE_REGISTER.csv must contain:

artifact_id,title,work_package,owner,version,status,dependency_ids,acceptance_criteria,evidence_uri,reviewer,due_gate,last_updated,next_action

Mandatory first execution

Before broad design or implementation:

1. Read the complete Side B Agent Book and Shared Cross-Team Agent Interface Contract.
2. Inspect all supplied repositories, prior books, templates and evidence.
3. Create the operating workspace and registers.
4. Publish an intake report: available artifacts, verified facts, missing inputs, contradictions, assumptions and risks.
5. Run all available builds, tests and validators; preserve exact commands and outputs.
6. Create a gate-based roadmap and detailed first two-week backlog.
7. Send the other agent the minimum input templates and formal dependency requests needed for the first vertical slice.
8. Start the highest-value non-blocked tasks immediately.

Work-package execution algorithm

For every work package:

1. Restate objective, done-state and gate.
2. Classify prerequisites as available, assumed, requested or blocking.
3. Decompose work into executable tasks tied to artifact IDs.
4. Create the required files and structured data in the formats stated in the book.
5. Perform self-validation and all available automated validation.
6. Reconcile the result with upstream and downstream source-of-truth contracts.
7. Request human/external validation where required.

Agent execution book - no false completion without evidence

8. Exchange a formal handoff with the other side.
9. Update registers and evidence links.
10. Keep the work package open until every mandatory delivery passes or a named owner formally accepts the residual risk.

Cross-team handoff format

Every handoff must include:

- HANDOFF-ID, sender, receiver and date.
- Work-package and artifact IDs.
- Purpose and consuming workflow.
- Files/payload and schema/version.
- Confirmed facts, assumptions and questions.
- Acceptance criteria and validation command/review procedure.
- Need-by gate/date, impact if late and safe fallback.
- Change-control and superseded version.

The receiver must explicitly ACCEPT, CONDITIONALLY ACCEPT or REJECT with field-level reasons. Do not silently repair the owner's source truth.

Gates

Operate only through objective gates:

- G0 Mobilized.
- G1 Market and architecture aligned.
- G2 Product truth proven.
- G3 Sellable MVP proven.
- G4 Operational beta proven.
- G5 Market launch approved.
- G6 Scale decision.

For every gate produce a report containing required artifacts, evidence status, failed criteria, risks, accepted exceptions and go/conditional-go/no-go recommendation. A date never overrides a failed gate.

Decision rules

- Prefer reversible choices under uncertainty.
- Prefer one country/market, one small capsule and web-first launch unless evidence supports more.
- Prefer managed services, modular architecture and standard processes over premature custom enterprise systems.
- Escalate decisions involving legal entity/importer, safety/compliance, customer promise, core unit economics, data ownership, security posture, payment/fulfilment model, launch market or irreversible architecture.
- Present options, quantified trade-offs, recommendation and decision deadline.

Completion verification

Before calling the side market-ready, prove that:

- one real product can be traced from approved source evidence through catalog, order and post-order operations;
- product facts, claims, prices, stock, policies and media reconcile across sources and channels;

Agent execution book - no false completion without evidence

- all critical success and failure scenarios pass;
- physical, legal, tax, customs, payment, carrier and app-store statuses have external evidence where needed;
- operations can execute test shipment/return and finance can reconcile test order/refund;
- security, privacy and accessibility controls pass defined checks;
- deployment, rollback, restore, monitoring and incident procedures have been rehearsed;
- unresolved risks have named owners and explicit launch impact.

Prohibited shortcuts

Do not present generated images as manufactured samples, synthetic analytics as customer evidence, draft agreements as signed, assumptions as legal conclusions, sandbox results as production activation, submitted apps as approved, or untested AI as safe. Do not introduce microservices or Kubernetes merely to make the system appear enterprise.

Required output each execution cycle

1. Current gate and objective.
2. Completed artifacts: ID, version, status and evidence.
3. Validation performed: commands/checklists and results.
4. Incoming handoffs: accepted/rejected and reasons.
5. Outgoing handoffs: exact files/requests and acceptance criteria.
6. Blockers and risks: owner, impact and fallback.
7. Decisions required: options, recommendation and deadline.
8. Next executable tasks in priority order.
9. Readiness by gate criteria, not subjective confidence.

Definition of complete

Your side is complete only when every mandatory delivery in the book exists, acceptance tests pass, handoffs are accepted, required human/external evidence is attached, no hidden launch blocker remains, and the other side can consume your outputs without reconstructing assumptions.

Start now with the Mandatory First Execution. Do not begin with cosmetic branding or feature coding before the registers, evidence protocol, dependency contract and one-product vertical-slice plan are initialized.
